tomorrowmensch relaunches as an operating capital company for the science after software

Philosopher and frontier-tech investor Anders Indset narrows tomorrowmensch to the convergence of quantum and life, and builds it on four verticals: Capital, Build, Experience and Intelligence.

Zürich, Switzerland. tomorrowmensch AG today relaunched as an operating capital company backing Europe's frontier technology at the convergence of quantum and life. The company invests in, builds and convenes the founders who use physics to measure, model and engineer living systems.

In 2011, Marc Andreessen wrote that software is eating the world. Fifteen years later, machines write much of the code: Google says three quarters of its new code is now generated by AI. tomorrowmensch is built on what comes next. When code costs almost nothing, what stays scarce is contact with reality: the instrument, the experiment, the living cell.

"Software was eating the world. Now software itself has been eaten," says Indset. *"What follows is science. Physics and biology are where the next decade is decided, and that is where we work."*

Quantum and life belong together because biology runs on physics. Quantum sensors that work at room temperature can already measure signals from living tissue, and they move biology from observation toward engineering. tomorrowmensch focuses on that seam and tests every quantum claim against the best classical alternative.

The company works through four verticals:

- **tomorrowmensch Capital** invests early in companies at the convergence of quantum and life.
- **tomorrowmensch Build** works inside companies on the category, the investor story, go-to-market and operations. Its first product, the network agent Falcor, is in preparation at meetfalcor.com.
- **tomorrowmensch Experience** brings founders, investors and scientists together, including during the World Economic Forum in Davos.
- **tomorrowmensch Intelligence** publishes books, research and briefings, among them *The Quantum Economy*, the Substack *Letters from Tomorrow* and an annual Global Outlook.

The relaunch continues the 20-year experiment Indset announced in 2025: to understand life and consciousness by trying to build them, and hoping to fail. *"We hope we fail,"* he says. *"But I have no guarantee that we will. That is exactly why philosophy has to build technology, not comment on it afterwards."*

About tomorrowmensch

tomorrowmensch AG is an operating capital company backing Europe's frontier technology at the convergence of quantum and life. Through Capital, Build, Experience and Intelligence it invests in, builds and convenes the companies of the science after software. Headquartered in Switzerland. tomorrowmensch.com

About Anders Indset

Anders Indset is a Norwegian-born philosopher, author and frontier-tech investor. He has given more than 1,200 keynotes worldwide and written nine books, including *The Quantum Economy*, *The Singularity Paradox* (with Florian Neukart) and *Ex Machina*. As founder of tomorrowmensch he tests philosophical questions in companies, technologies and capital.
